Project Design Phase
Proposed Solution Template

Date	19 July 2026
Project Name	RentEase Platform
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Prospective tenants struggle with unverified housing listings, potential scams, and the stress of manually coordinating physical tours over phone calls. Simultaneously, real estate landlords suffer from disorganized scheduling and unqualified spam inquiries.
2.	Idea / Solution description	RentEase is a full-stack, multi-role marketplace bridging Renters and Property Owners. It provides an Admin-verified gateway for landlords, an inline "Lease Scheduler" for seamless physical tour booking, and dynamic dashboards for real-time status tracking (Pending, Confirmed, Cancelled).
3.	Novelty / Uniqueness	Unlike traditional listing sites that merely act as classified boards, RentEase integrates a built-in Booking Coordinator with 1-click approvals and strictly enforces Admin-verification before any property can be posted. This effectively eliminates fake listings and centralizes the tour coordination workflow.
4.	Social Impact / Customer Satisfaction	Significantly reduces housing search anxiety and saves vast amounts of time for renters by restoring trust in the digital real estate market. Saves landlords hours of manual texting, leading to a highly professional, secure, and satisfying experience for both parties.
5.	Business Model (Revenue Model)	The platform operates on a freemium model for Renters. Revenue is generated via a subscription-based or pay-per-listing model for verified Property Owners. Future revenue streams include premium "featured" property placements and transaction fees for in-app digital lease signing.

S.No.	Parameter	Description
6.	Scalability of the Solution	Built on a highly scalable SPA architecture using React/Vite with a decoupled RESTful API (Express.js). Currently utilizing a lightweight JSON store for rapid deployment, the data layer can seamlessly be migrated to a robust Cloud RDBMS (e.g., PostgreSQL) as the user base and traffic grow.
